

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A combination of a cylindrical wrapped bush bearing whose inner peripheral surface is a sliding surface, and an aluminum-made housing in which the bush bearing is press-fitted, wherein ~~and an aluminum-made housing in which the bush bearing is press fitted,~~ said cylindrical bush bearing comprising an inner peripheral surface having a sliding surface, an outer peripheral surface of the bush bearing has ~~having~~ a cylindrical surface, one annular axial end face, another annular axial end face, and a tapered flat surface interposed ~~and extending continuously in an axial direction from the one annular axial end face toward said other annular axial end face~~ between the cylindrical surface and at least ~~said~~ one annular axial end face of the bush bearing and formed by press forming, wherein a difference $\delta (= r_1 - r_2)$ between a radius r_1 of the bush bearing at the cylindrical surface of the bush bearing ~~outer peripheral surface~~ and a radius r_2 of the one annular end face at an outer peripheral edge of the one annular ~~axial~~ end face is in a range of not less than $0.1t$ and not more than $0.3t$, where t is a wall thickness of the bush bearing at the cylindrical surface of the bush bearing ~~outer peripheral surface~~, wherein the tapered surface extends in an axial direction continuously from the one annular end face, and the cylindrical surface extends continuously in the axial direction from the tapered surface toward another axial end face of the bush bearing, the bush bearing being constituted by a wrapped bush bearing in which including a multilayered plate having which has the sliding surface on one surface thereof ~~and is convoluted into a cylindrical shape such that the sliding surface is positioned on an inner peripheral side, the plate being constituted by a said multilayered plate which includes~~ including a back plate entirely coated with copper, a porous

sintered metal layer adhered integrally to a copper coating layer on one surface of the back plate, and a sliding layer including a synthetic resin with which the porous sintered metal layer is impregnated, and which has self-lubricity and wear resistance, a portion of said sliding layer ~~which includes said synthetic resin being~~ formed on one surface of the porous sintered metal layer, and the wrapped bush bearing is formed by ~~convoluting the multilayered plate into the~~ cylindrical shape such that the sliding layer is positioned on the inner peripheral side, the cylindrical surface, the tapered surface and the one annular end face being constituted by consisting of an exposed surface of the copper coating layer, the tapered surface extending in the axial direction between the cylindrical surface and the one annular end face so as to be flat or convex toward an outside, said bush bearing further comprising a first smooth circular arc surface being interposed between the tapered surface and the cylindrical surface, the first smooth circular arc surface having a radius of curvature which is not less than 0.1 mm and not more than 1.0 mm, and a second smooth circular arc surface being interposed between the tapered surface and the one annular axial end face, the second smooth circular arc surface having a radius of curvature which is not less than 0.1 mm and not more than 0.5 mm, an angle θ of intersection ~~θ~~ between the tapered surface and an axial line being not less than 15° and not more than 25°, the outer peripheral edge of the one annular axial end face having a smaller diameter than a diameter of a hole of the aluminum-made housing in which the bush bearing is press fitted.

Claims 2-11 (Canceled)

12. (Previously Presented) The combination according to claim 1, wherein the tapered surface is formed by roll forming.

13. (Previously Presented) The combination according to claim 1, wherein the outer peripheral surface of the bush bearing further has, in addition to the tapered surface interposed between the cylindrical surface and the one annular end face, another tapered surface interposed between the cylindrical surface and the other annular axial end face of the bush bearing and formed by press forming.

14. (Previously Presented) The combination according to claim 13, wherein the other tapered surface extends in the axial direction continuously from the other annular end face, and the cylindrical surface extends continuously in the axial direction from the other tapered surface toward the one axial end face of the bush bearing.

15. (Previously Presented) The combination according to claim 13, wherein the other tapered surface extends in the axial direction between the cylindrical surface and the other annular end face so as to be flat or convex toward the outside.

16. (Previously Presented) The combination according to claim 13, wherein a smooth circular arc surface is interposed between the other tapered surface and the cylindrical surface.

17. (Previously Presented) The combination according to claim 16, wherein the smooth circular arc surface interposed between the other tapered surface and the cylindrical surface has a radius of curvature which is not less than 0.1 mm and not more than 1.0 mm.

18. (Previously Presented) The combination according to claim 13, wherein a smooth circular arc surface is interposed between the other tapered surface and the other annular end face.

19. (Previously Presented) The combination according to claim 18, wherein the smooth circular arc surface interposed between the other tapered surface and the other annular end face has a radius of curvature which is not less than 0.1 mm and not more than 0.5 mm.

20. (Previously Presented) The combination according to claim 13, wherein an angle of intersection, θ , between the other tapered surface and the axial line is not less than 15° and not more than 25° .

21. (Previously Presented) The combination according to claim 13, wherein the other tapered surface is formed by roll forming.

22. (Previously Presented) The combination according to claim 13, wherein the other tapered surface is constituted by an exposed surface of the copper coating layer.
